

Prototyping

Assignment

Summer 2025

Contents

Prototyping Plan 1

Generic Description of Your Product Idea That Is Being Developed. 1

Identifying product end users by choosing the suitable end user categorizations, classifications and behavior modelling techniques. 2

Determining the suitable methodology. 7

Outlining the right tools to prototype your idea (example, JustInMind, Figma, Mockups…) 8

Planning prototype evaluation methods. 8

Iteration 1 (Survey) 9

Feedback – outlining the end users' feedback on the first iteration of the wireframe. 9

6.3 iteration 2 (Survey) 13

6.3.1 Feedback – outline the end users' feedback on the second iteration of your wireframe. 13

6.4 Screenshots after applying feedback (of the updated wireframes only) 16

Mid-fidelity Mock-up 18

Mockups screenshots before applying feedback. 18

Iteration 1 (A/B) 23

Feedback - outlining the end users' feedback on the first iteration of the Mockup. 23

iteration 2 (Usability) 27

Feedback- - outlining the end users' feedback on the second iteration of the Mockup. 27

Screenshots after applying feedback (of the updated mockups only). 29

High-fidelity Prototype 33

Outlining the added features to build your high-fidelity prototype, ... 33

Reviewing end-user feedback from multiple iterations of your prototype and justifying the updates to the final prototype based on end user feedback and testing. 40

Critically evaluating the prototype against the original plan and how user feedback and testing was implemented. 42

References 43

Prototyping Plan

Generic Description of Your Product Idea That Is Being Developed.

Takke is a Website that offers paid sound engineering courses, and it offers a special learning experience for beginners and professional sound engineers. Takke is designed for aspiring and

passionate sound engineers who are looking to upgrade their sound production skills and for aspiring people who want to be sound engineers. Our users share a common aspect which is learning an innovation in the field of sound engineering. Users do not only browse, but they will look on their learning trip in the sound engineering field.

Identifying product end users by choosing the suitable end user categorizations, classifications and behavior modelling techniques.

- Categorization: In this part I will know who our target audience are:
    - Beginners: beginners who are seeking into starting in the sound engineering career and path.
    - Juniors & Seniors sound engineers: Already working sound engineers who are seeking to upgrade their sound engineering, mixing, and mastering skills.
    - Professional sound engineers: Already professional sound engineers who are seeking also to upgrade their skills and have more advanced skills.

- Classification:
    - Segmentation:

Geographic Segmentation

People that can speak Arabic in the MENA and globally

Demographic Segmentation

Age: 18 - 45
role: student, junior/senior sound engineers, and professional sound engineers.

Lifestyle Segmentation

People who are interested in the sound engineering industry, and people who are already working in the sound engineering industry, so their lifestyle could be people who are performing sound engineering activities daily or weekly, and who are wishing to start performing sound engineering activites.

Behavioral Segmentation

See what are the courses that are purchased and completed.
See what are the courses that are the most viewed.

Business Segmentation

Small and mid studios who seek upgrade their employees skills

- User Persona:

Name: Khaled Alazab

Age: 25

Occupation: Junior sound engineer

Location: Jordan

User Description:

Already working sound engineer, handles mixing and mastering, and wants to improve his skills and finish his work faster.

Personal Characteristics: 1. Ability to work under pressure. 2. Prefers Arabic learning. 3. Organized. 4. Prefer to work alone than working with a team. 5. Keeping up with new technologies.	Hobbies and Interests: Music production, listen to most categories of music, live-sound engineering, and mixing tv shows sound.
Goals: 1. Upgrade their skills. 2. Finish work faster. 3. Earn more certificates.	Challenges: 1. work flow is slow. 2. Miss deadlines. 3. Limited manager feedback 4. too many apps choices.
Needs: 1. Platform offers sound engineering courses. 2. Easy to use platform. 3. Fill his free time.	Sources of Info: 1. Facebook groups. 2. Discord communities

Name: Rami Ahmad

Age: 19

Occupation: Student

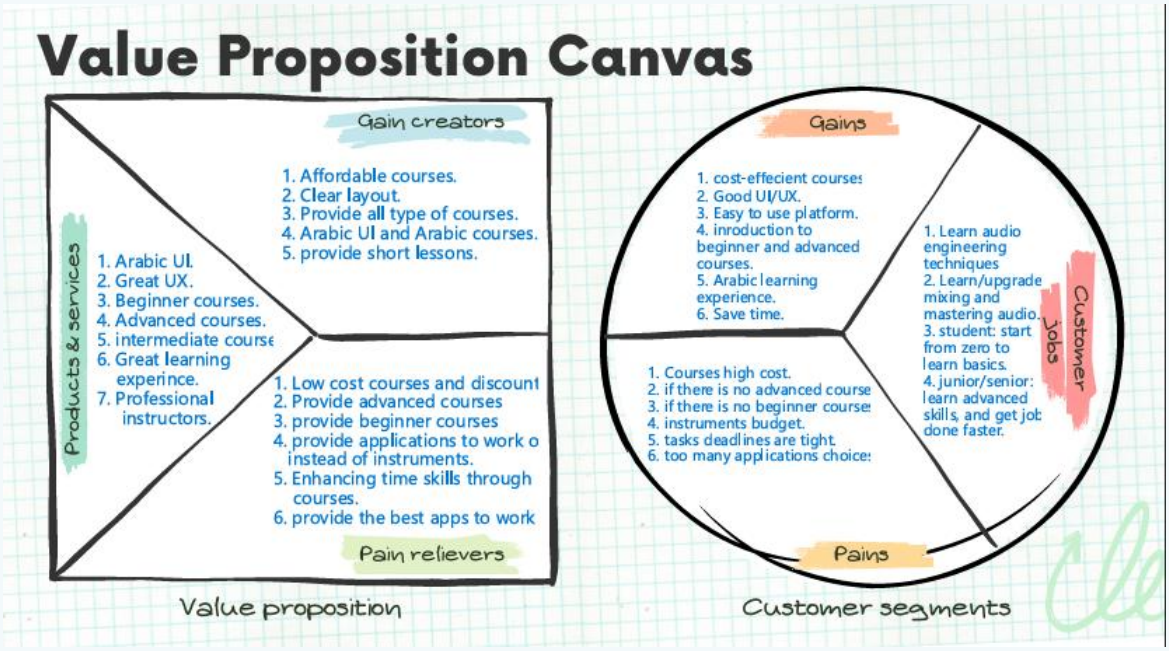

Location: KSA

User Description:

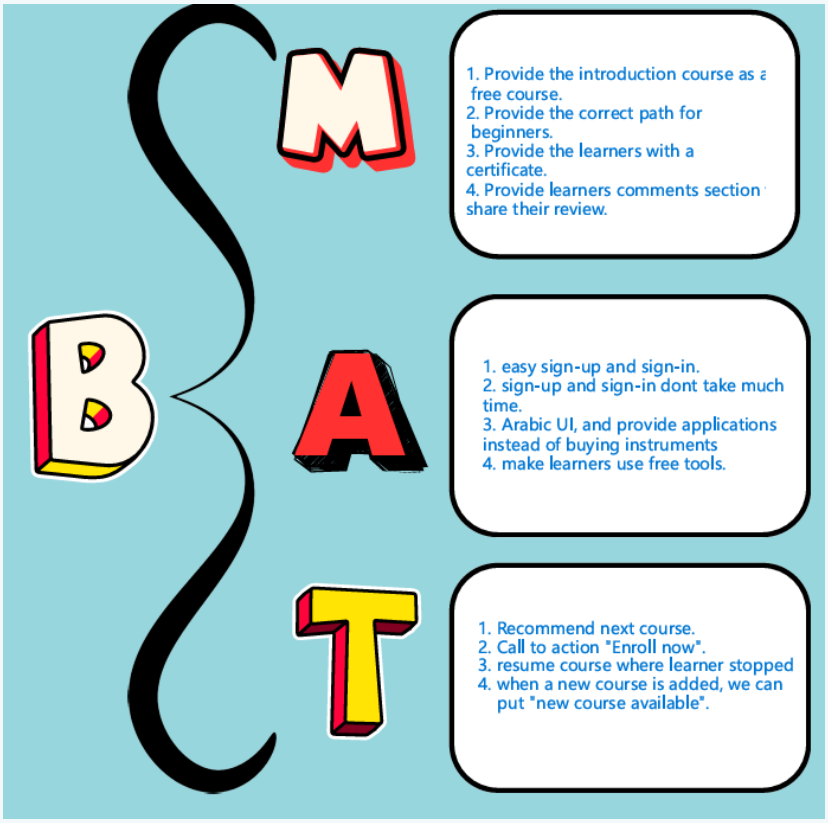

A student who wants to start their career in audio engineering industry and wants to make Simple and clear path to learn for mastering and mixing from zero to hero.

Personal Characteristics:	Hobbies and Interests:
1. Prefers Arabic learning 2. Organized. 3. Patient on learning.	1. Listen to music 2. Interested in sound production. 3. Watching mixing tutorials. 4. perform sports.
Goals: 1. learn new skills. 2.. start a career in audio engineering. 3. Build portfolio and earn certificates.	**Challenges:** 1. Does not know where to start. 2. Limited Platforms.. 3. Limited instructor feedback 4. too many apps choices.
Needs: 1. Guided path for beginner 2. simple and easy to understand lessons. 3. Easy to use platform. 4. Good platform.	**Sources of Info:** 1. Facebook groups. 2. Discord communities

- Value Propositon:

- Behavior modelling technique: I used it to buy the first course.

Determining the suitable methodology.

There are multiple methodologies to use, each one serves different purpose. In my project I used the suitable methodology which Rapid Throwaway prototype methodology because it is the best suitable methodology to use for Takke as the process will be building initial low fidelity prototype then get feedback then edit then repeat, then building mid fidelity prototype then get feedback then edit then repeat, building low and mid fidelity prototypes will have two iterations.

After that I build the final high-fidelity prototype based on all the feedback I collected, everything is created using Figma to simulate the final product.

I used rapid throwaway because it is the easiest and cheapest to use, the quicker to do, get quick feedback. Also, to reduce risk of misunderstanding because some requirements and concepts could be misunderstood due to the unclear requirements. Also, because changes are acceptable and I could have a change in the earlier phases and it doesn't take a large amount of time as not all the requirements are clear, I must be sure about all the requirements, and to test concepts and user interface to see if they are good, usable, and preferred by users.

Outlining the right tools to prototype your idea (example, JustInMind, Figma, Mockups…)

- Figma: Figma was used to build the prototype starting from the low to mid to high fidelity prototype, figma helped me to make wireframe, mockups design, and the whole clickable simulation of the final product.

- Ready to use templates: Ready to use template was provided on the eLearning system, these templates are used to create user classification techniques such as user segmentation, user persona, and value proposition canvas. Also, it was used to create behavior modelling techniques such as BJ Fogg's behavior model.

- Google Forms: Google Forms was used to create survey that targets specific group to gain feedback on the prototype.

Planning prototype evaluation methods.

In the prototype evaluation I will use two evaluation methods that will help me to collect user feedback to produce a high-quality prototype that users like and comfortable with, I will use Surveys for low-fidelity evaluation, and A/B testing for mid-fidelity evaluation and I may use Usability testing if needed.

- Surveys: Surveys are used in both low-fidelity processes to collect feedback from different users. Surveys are used because they are cost-effective and collect feedback from a large number of users to cover ideas and what I should change about the layout, and positions.

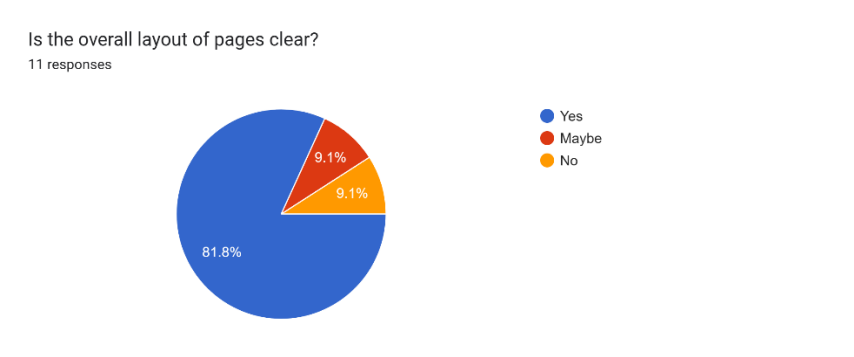

- A/B Testing: A/B testing will be used in the mid-fidelity process to validate the design of the application as I will send a survey containing images from the application in different designs and compare them to find out which one is preferred by the users and decide based on the feedback collected.

- Usability Testing: I will use usability testing if needed because usability testing helps me to identify whether Takke is usable or not, and to collect information about users. I will use unmoderated usability testing as I will send a link to the users with specific tasks to do and collect voice recording feedback from them. Unmoderated usability testing is used because it is quick, which saves time and it is cost efficient.

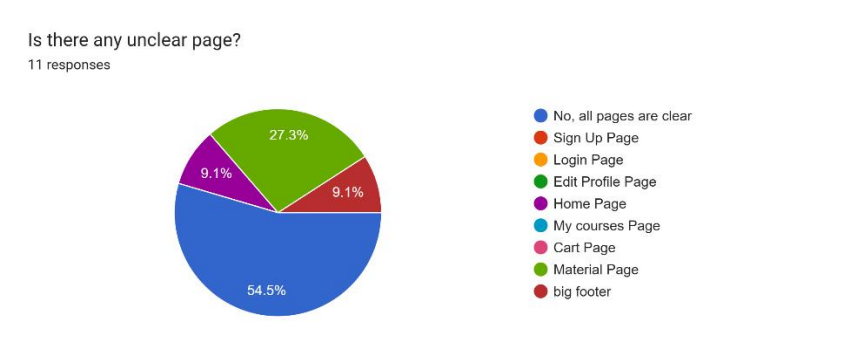

Iteration 1 (Survey)

Feedback – outlining the end users' feedback on the first iteration of the wireframe.

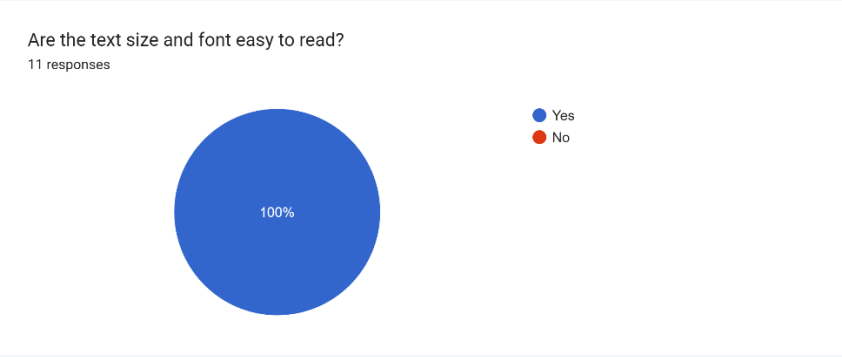

Survey Link: https://forms.gle/5vDTXJ8k64VLBrxJ6

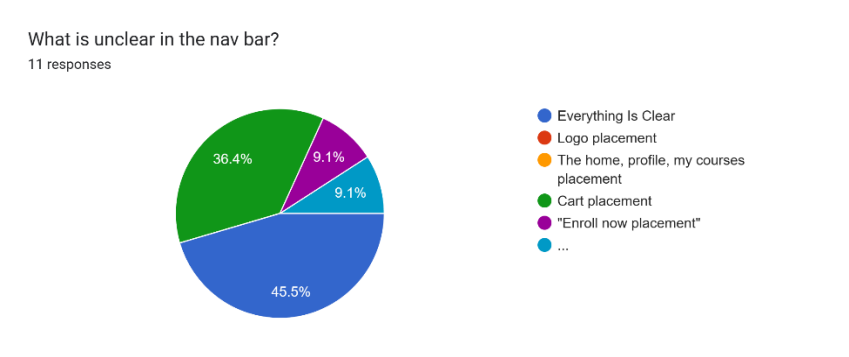

81.8% of the users says that the overall layout is clear, 9.1% says it is not clear, 9.1% says maybe it is clear, but the highest percentage says that it is clear.

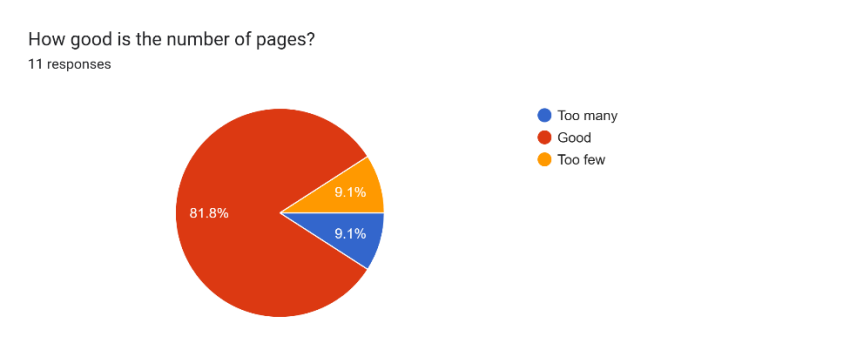

54.5% says that all pages are clear, 27.3% says that the material page is not clear, 9.1% says the home page is not clear, and 9.1% says that the footer is big, so I must think of the material page. I will not look about the material page for now unless users says it is unclear in iteration two because not too many people didn't like the material page.

100% of the users says that the texts are easy to read.

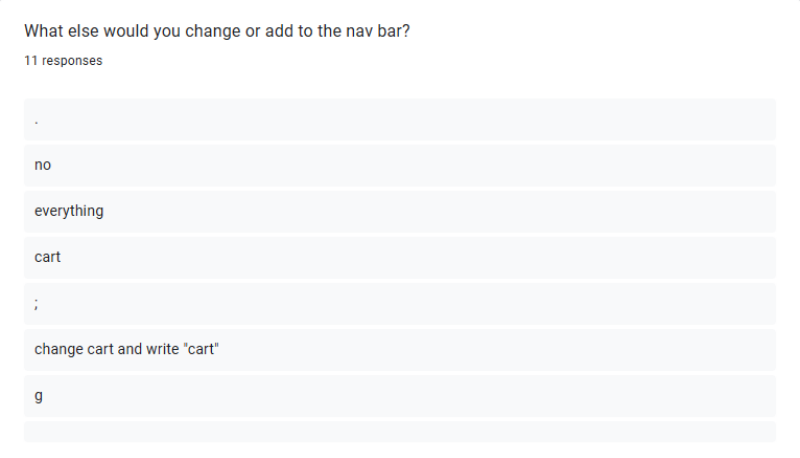

45.5% says that everything is clear, 36.4% says that cart placement is not clear so I must think about it, 9.1% says that “enroll now” placement is not clear.

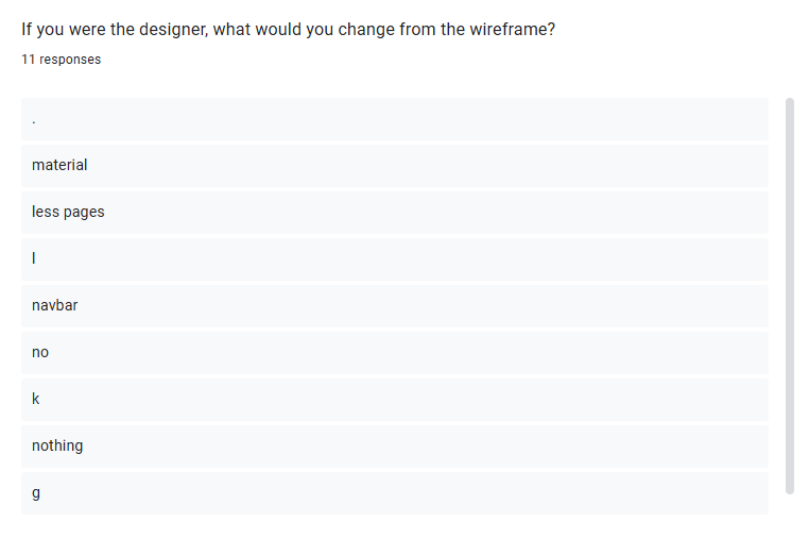

Most of the users says that the number of pages is good so I will not add or remove any page.

Some users say big footer, nav bar, and cart but I think they mean the cart in the nav bar because in the question below they also said cart which means the cart in the nav bar. Other responses are useless.

Some users says cart and everything and the other responses are useless.

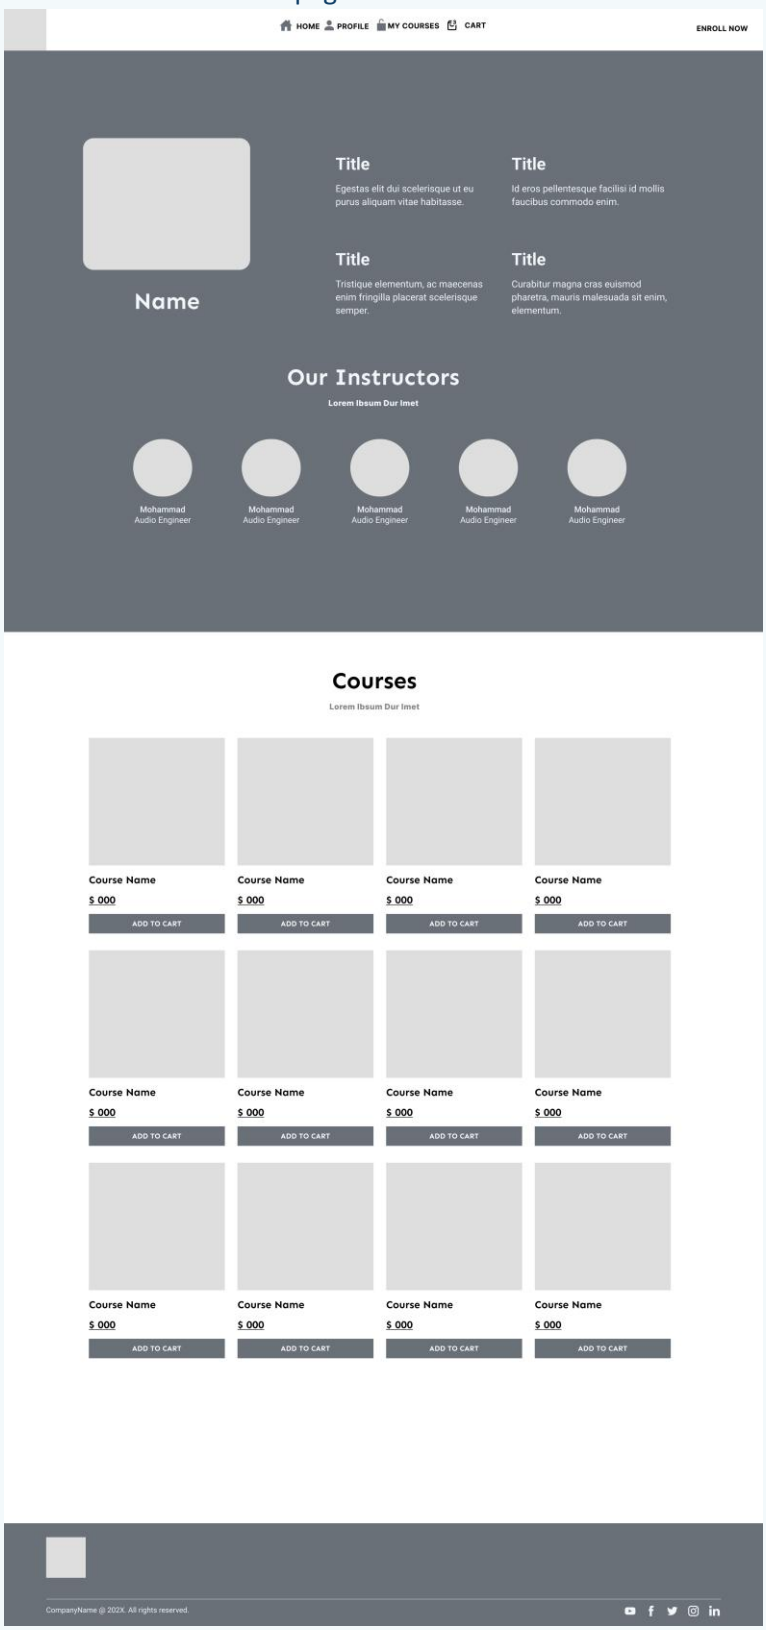

Some users say material page, navbar, remove pages or the pages are few it is not clear but the other responses are useless.

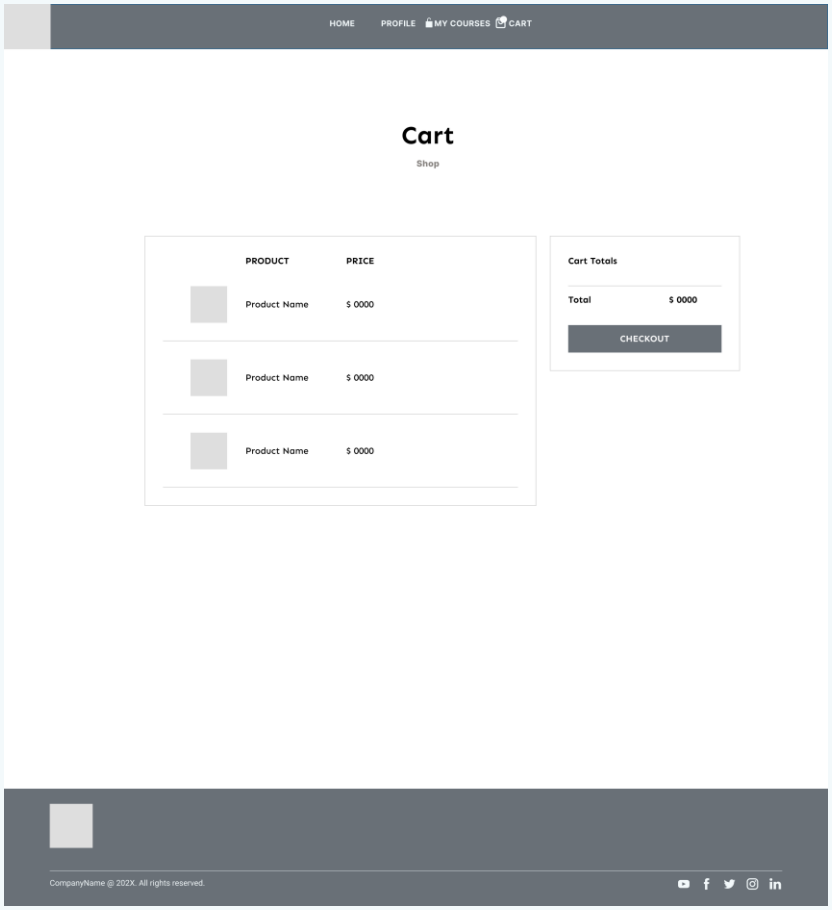

Screenshots after applying iteration 1 feedback:

I only changed the cart logo and placement.

The navbar in the home page after iteration 1:

The navbar in other pages as there are common after iteration 1:

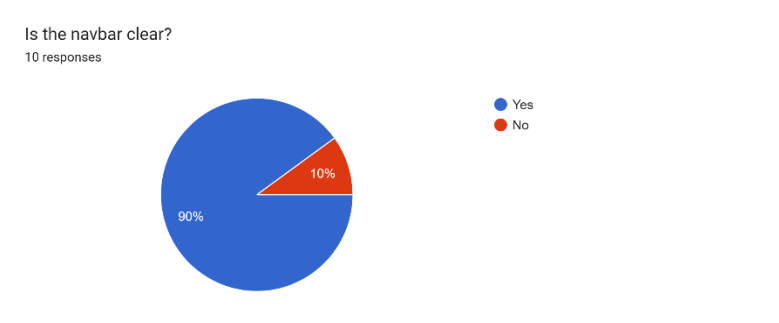

6.3 iteration 2 (Survey)

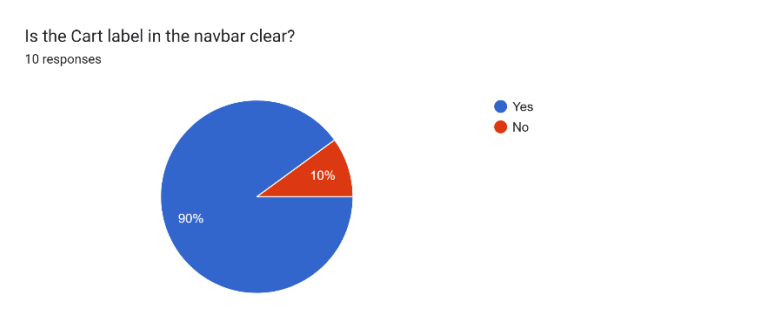

6.3.1 Feedback – outline the end users' feedback on the second iteration of your wireframe.

In iteration 2 I focused on the things that a low percentage of users thought it should be changed which I didn't change in iteration 1.

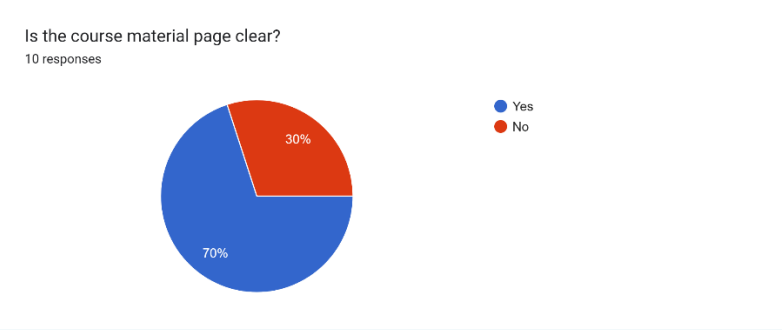

Survey Link: https://forms.gle/CoguDjyoQrXy47gy6

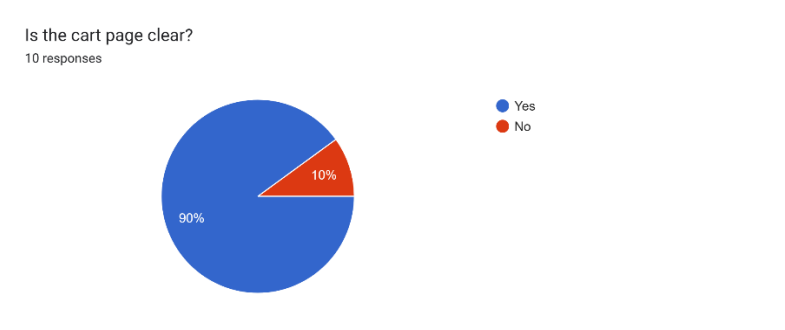

90% of the users says the nav bar is clear now which is an improvement.

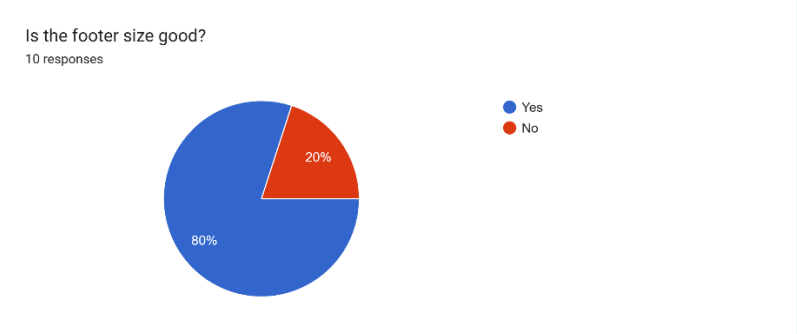

90% of the users says the cart label in the nav bar is clear now which is an improvement.

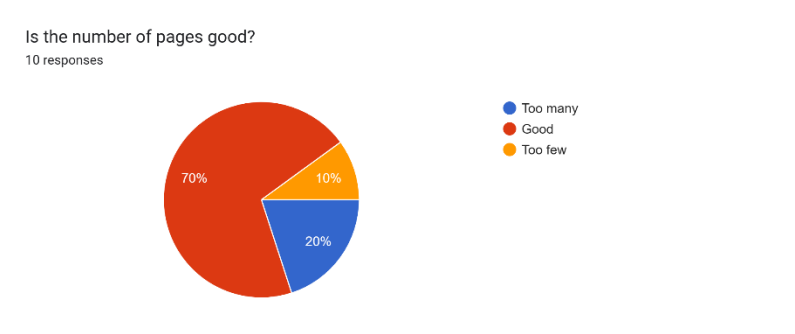

70% says the course material page is clear but 30% says it is not so I may change it.

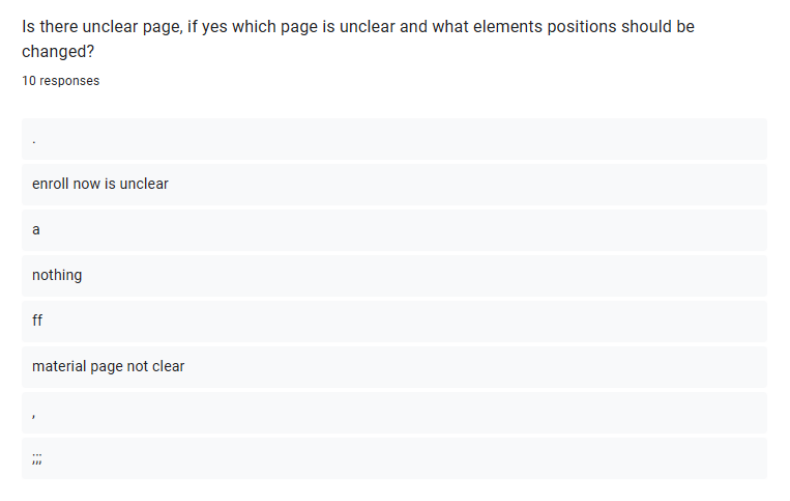

90% says the cart page is clear so no changes needed.

80% says it is good but 20% says it is not so I may change the size of the footer.

Most of the users says the number of pages is good so I will not add or remove pages.

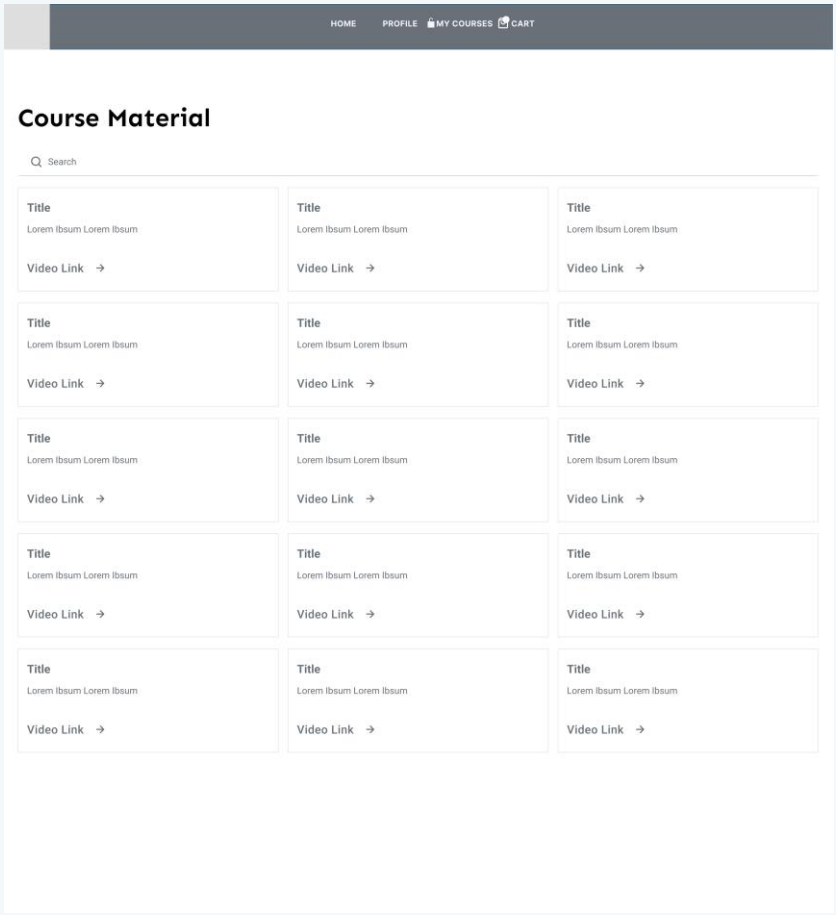

Some users said enroll now button is unclear, and material page is unclear. Other responses are useless.

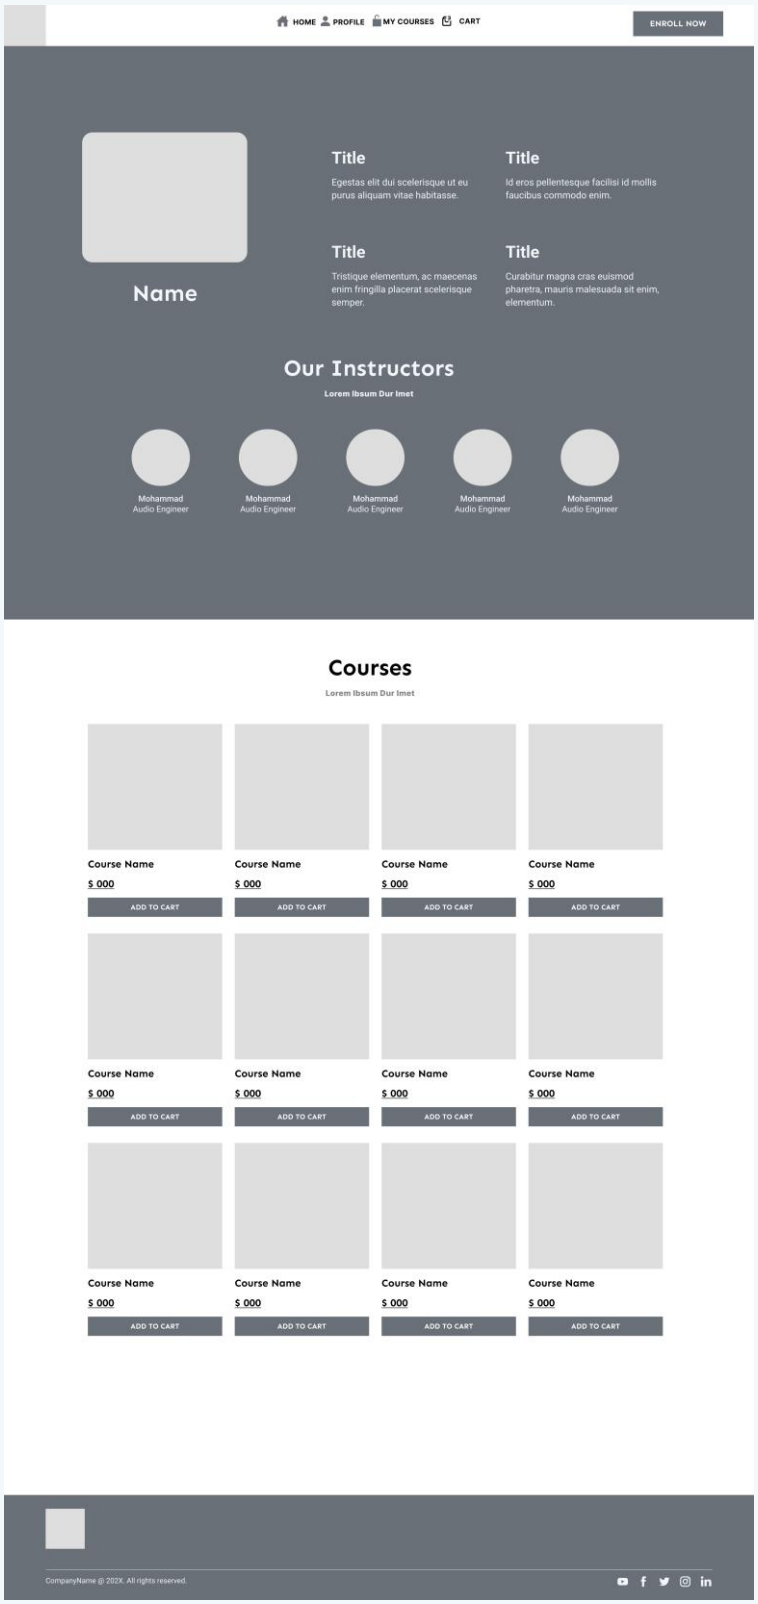

A user said material page should be improved so I will improve that page.

6.4 Screenshots after applying feedback (of the updated wireframes only)

In iteration 2 and after collecting feedback, I realized that material page is unclear so I will improve it. Also, footer size and enroll now button is not good so I also will improve it. the footer is common between all pages.

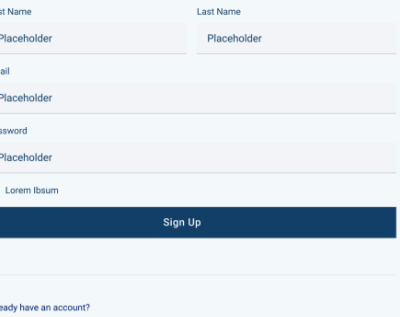

Last version of the low-fidelity prototype: Low-Fidelity Prototype

Mid-fidelity Mock-up

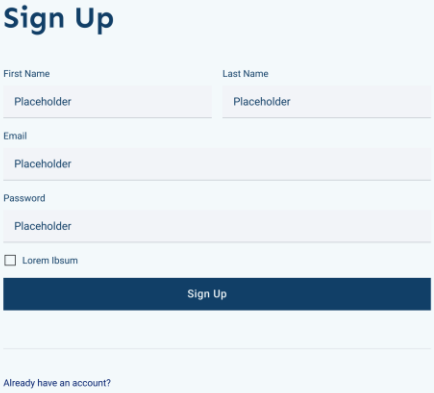

Mockups screenshots before applying feedback.

In the Mockup I created two designs for each page but I did not choose one of them yet so I will put both here.

Iteration 1 (A/B)

Feedback- outlining the end users' feedback on the first iteration of the Mockup.

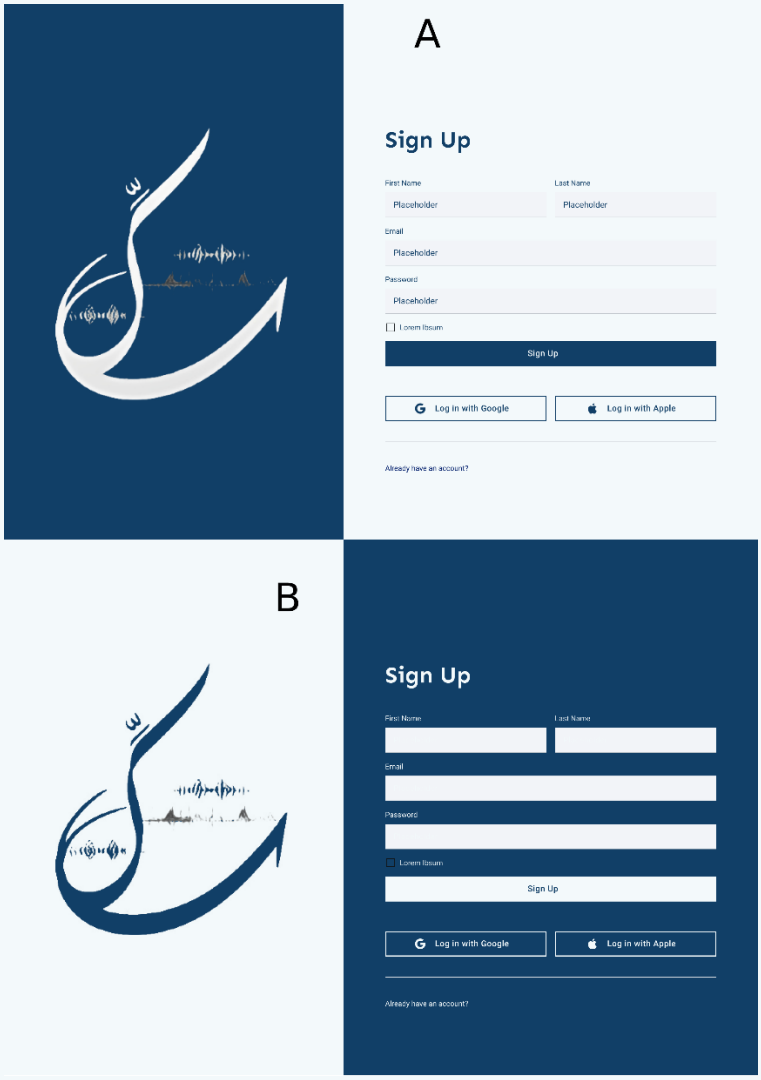

I used A/B testing to test two designs of takke as I used survey containing pictures from the two designs one of them was the control, and the other was the experiment and the control won.

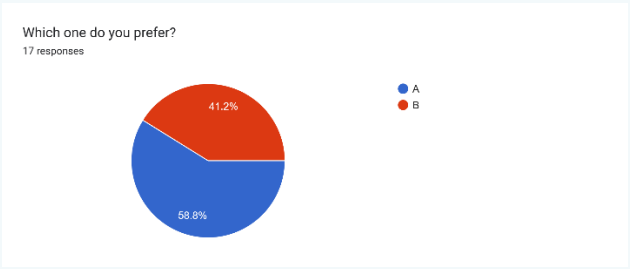

Survey Link: https://forms.gle/2Rbwkm6jw3DZ5BqMA

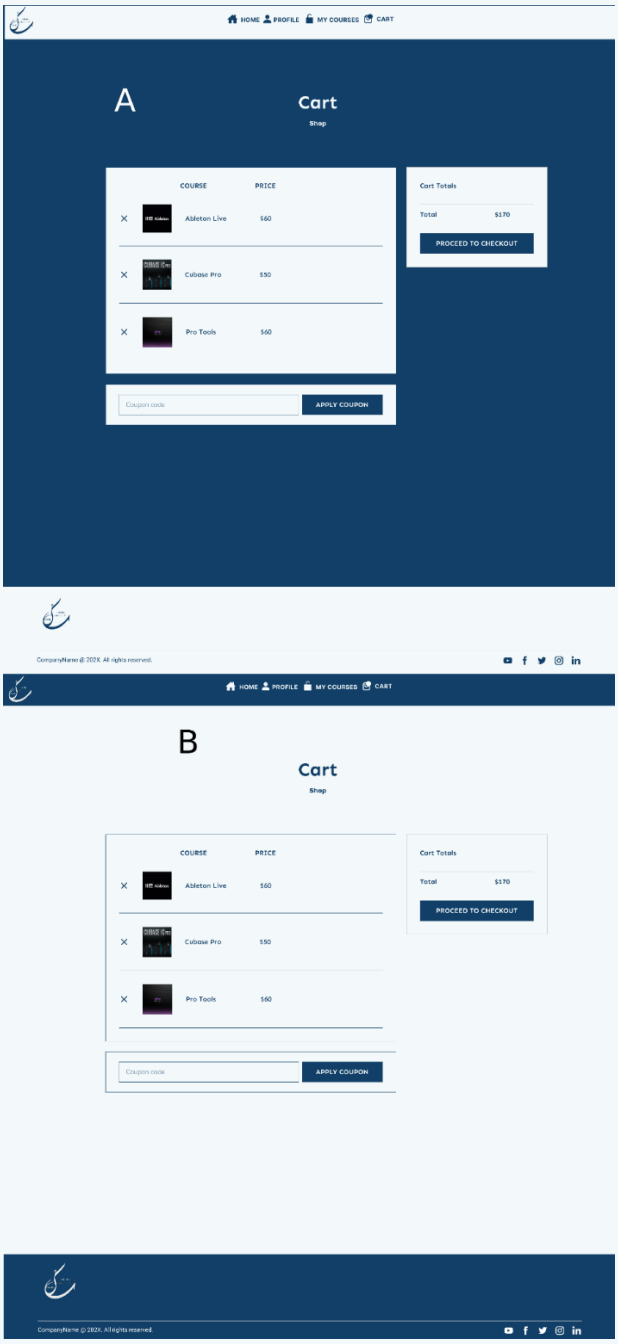

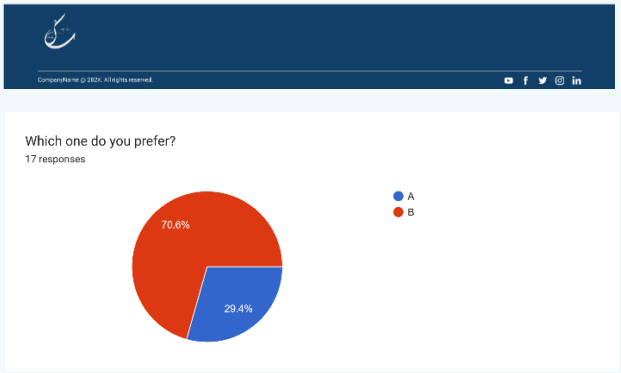

Here most of the users preferred design A (the control) for the "home" page as 76.5% preferred A, and 23.5% preferred B (the experiment) so I will go with A.

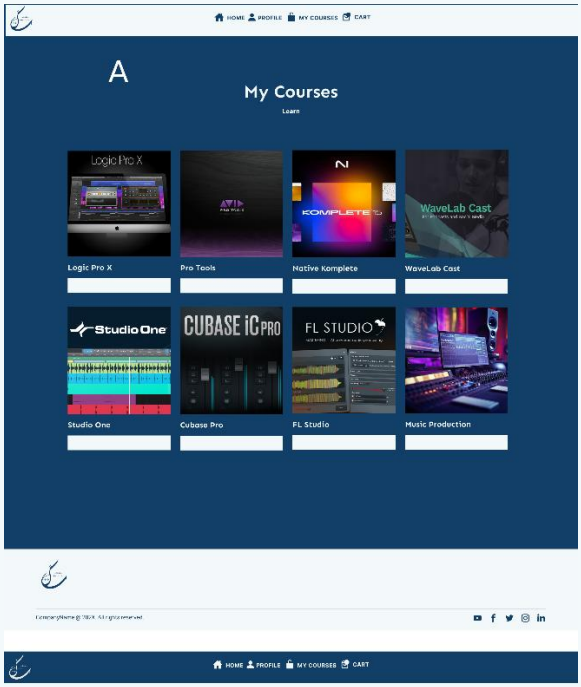

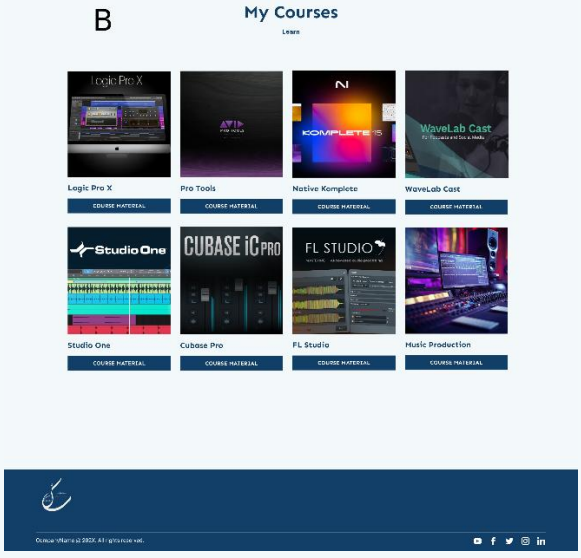

For the “signup, signin, and update profile” pages most of the users preferred design A (the control) as 58.8% preferred A, while 41.2% preferred B (the experiment) so I will go with A.

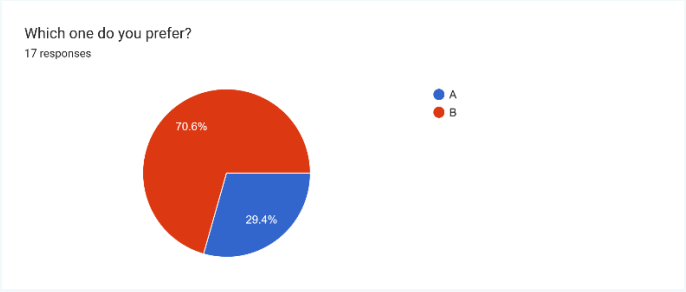

For the “cart” page most of the users preferred design B as 70.6% preferred B (the experiment) and 29.4% preferred A (the experiment) so I will go with B.

And lastly, for “my courses” page, 70.6% preferred design B (the control) while 29.4% preferred design A (the experiment) so I will go with B.

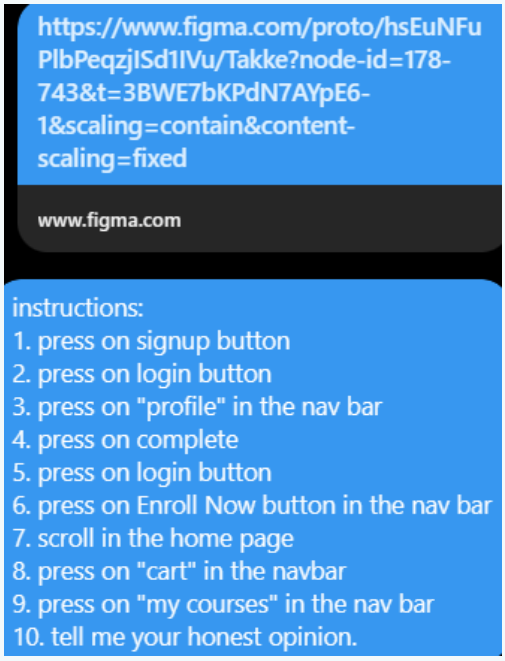

After collecting feedback from iteration 1 I will go with design 1 (the control) because most of the users preferred it on experiment design.

iteration 2 (Usability)

Feedback-- outlining the end users' feedback on the second iteration of the Mockup.

Here I used unmoderated usability testing as I sent the mockup link to users with instructions, and they told me their opinion but why I used unmoderated usability testing at the last iteration? To make sure that all the users are satisfied with the Website now, to see if I should change something before starting to create the high-fidelity prototype and to make sure that I can now create the high-fidelity prototype based on the mockup without any problem and to not change anything after starting with the high-fidelity.

I will list the voice recordings I got from the users below, but now here is my message and instructions to the users:

1. Omar feedback recording: Omar alqudah feedback - YouTube
   Omar said that the Ibsite is very good and the courses and everything was clear, and he didn't have any problem experiencing the Ibsite.

2. Salah feedback recording: Salah alremawi feedback
   Salah said that the colors are appropriate and everything in all pages was very clear and the design is very good for the human eye, and the cart is easy to deal with.

3. Laith feedback recording: Laith alshuyyab feedback
   Laith said the Ibsite is very good, starting from the login and ending with the cart and everything is clear in the Website, lastly the Website is very good.

4. Ayman feedback recording: Ayman alkhlyfat feedback
   Ayman said that the Website is very good. He also said that he has some problems signing up and buying from Website and he cancels the idea, but Takke is easy to use, easy to create account, and the colors are great.

5. Dima feedback recording: Dima aldghimat feedback - YouTube
   Dima said that the Website is very good, colors are clear, there are a variety of courses, and the overall experience was very good and very good to the human eye, the positions of elements are good, and she also liked the logo.

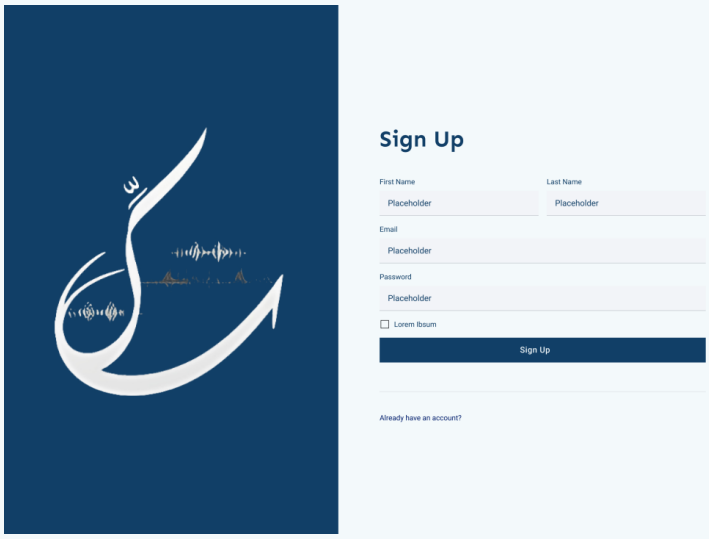

6. Ahmad feedback recording: Ahmad almuheisn feedback - YouTube
   He said that the Website is very good and nice, the colors are beautiful, and the most beautiful page is the home page and how I positioned courses and mentioned “From zero to hero” slogan and he also liked “my courses” page.

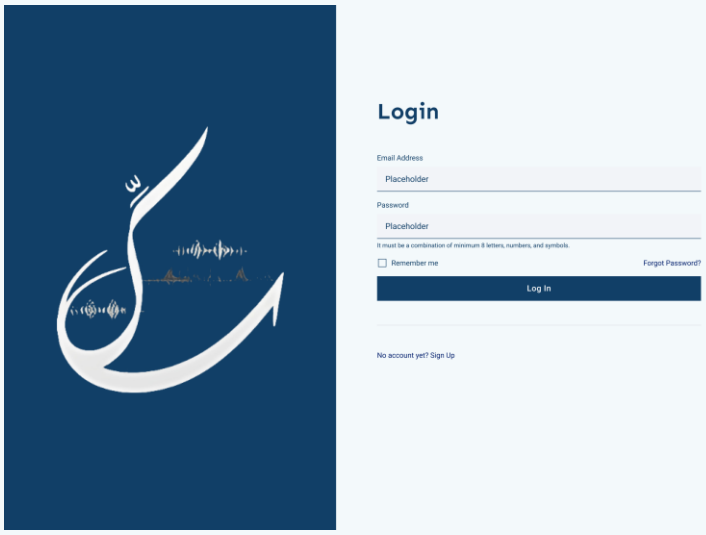

7. Abdullah feedback recording: Abdullah abu eid feedback - YouTube
   He said the interface, courses name, and instructors’ section are very good. The design is very beautiful.

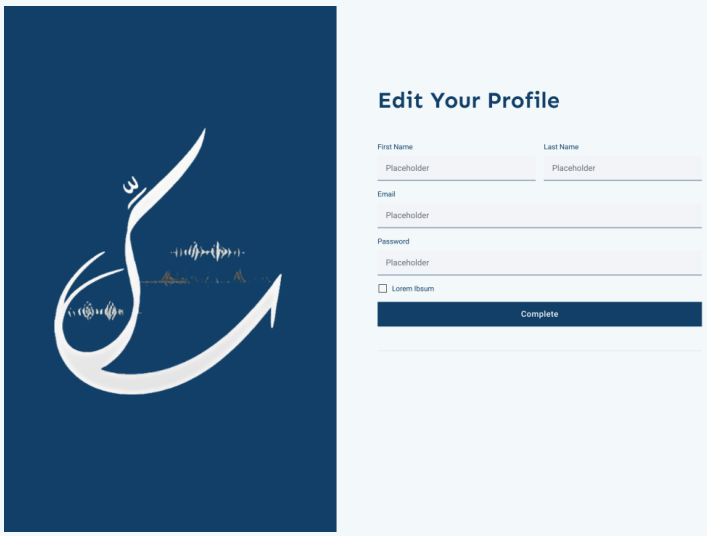

8. Abdulraheem feedback recording: Abdulraheem feedback - YouTube
   The colors Ire good and relief to the human eye, the elements positions are very clear, and it is easy to use, the main interface is very good as Ill as the logo and easy to navigate with the design and the Website.

Most of the users Ire satisfied with the final result as now everything is clear and good, and I will not change anything in the Website and their satisfactions was like an approval to go on and build the final high-fidelity prototype.

Screenshots after applying feedback (of the updated mockups only).

Last Version Of The Mid-Fidelity Prototype: Mid-Fidelity Prototype

High-fidelity Prototype

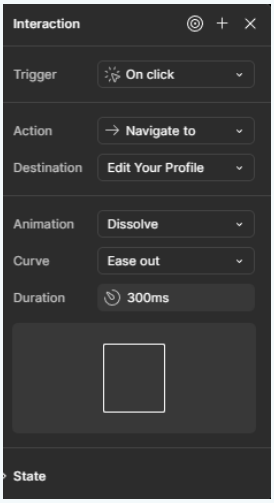

Outlining the added features to build your high-fidelity prototype,

In this phase, I tried to add interactions, and validation to make the prototype similar to the final product as I added:

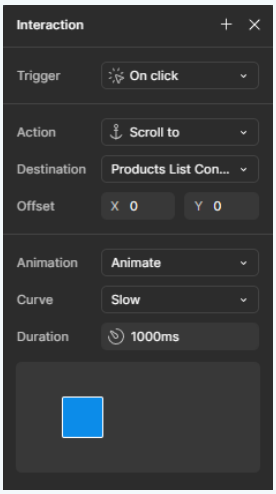

- Page Flow or Navigation: I made links between pages and made a good smooth flow for the application (signup page → login page → home page → cart page → my courses page → course material page → edit profile page → login page).

- Transitions: I used the same transitions for all the pages to improve the experience of the user as I used dissolve transition with ease out curve with a 300ms duration.

- Smart Smooth scroll for the CTA button: the CTA button in my application does an action which is scroll to the courses section, but the scroll was not good and smooth, so I used a scroll animation with slow curve and 1000ms duration. I Also made the CTA button interactive by using hover.

ENROLL NOW ENROLL NOW

- Interactive Checkbox: checkboxes Ire not interactive and functional, so I used variants to make the checkboxes interactive and functional.

Remember me Remember me

- Interactive Buttons: the buttons Ire not interactive, so I used variants to make all the buttons interactive as I added hover to them.

Login

when mouse hover on the button:

Login

- Interactive Navbar: I made the navbar interactive and I improved its navigation. By using variants, I was able to make the navbar interactive.

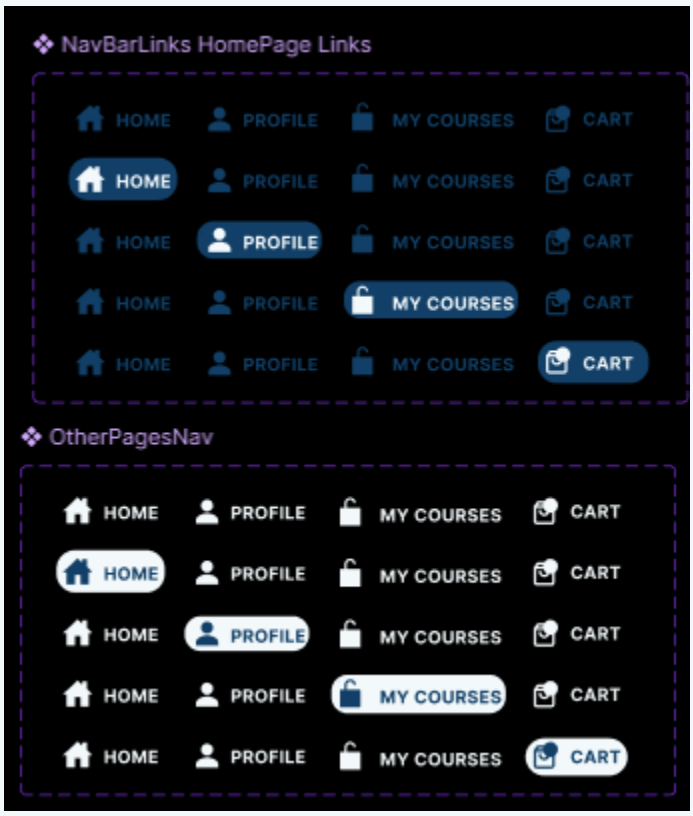

when mouse hover on profile:

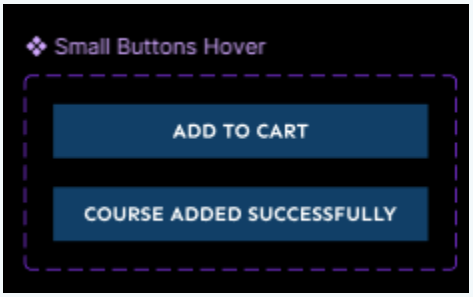

When mouse hover on home:

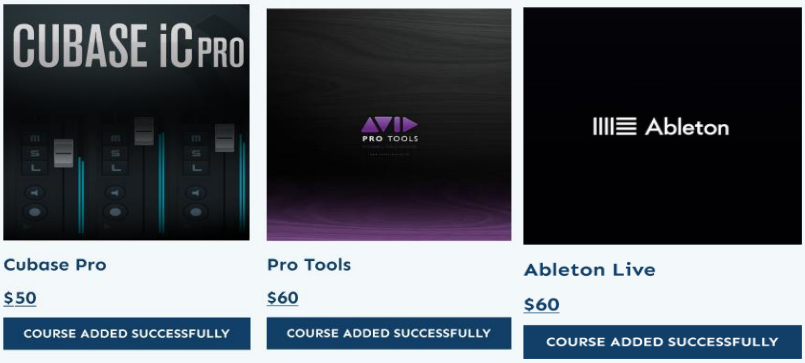

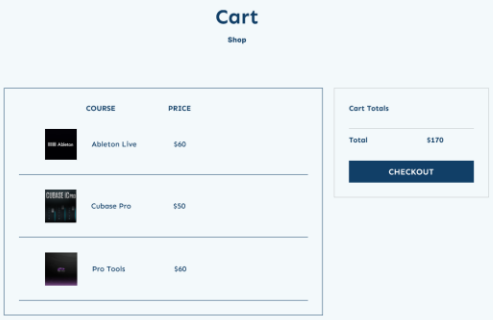

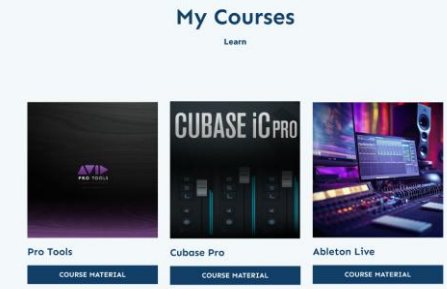

- Realistic add to cart process: I did a scenario where we can make the add to cart process realistic as I used variants to add to cart button to change to course added successfully when clicked but I could not make it fully realistic because I could not connect the cart with the courses available because we don't have a database as the courses that can be added to cart in my scenario are "Cubase Pro, Pro Tools, Ableton Live" and these courses will be in the cart page.

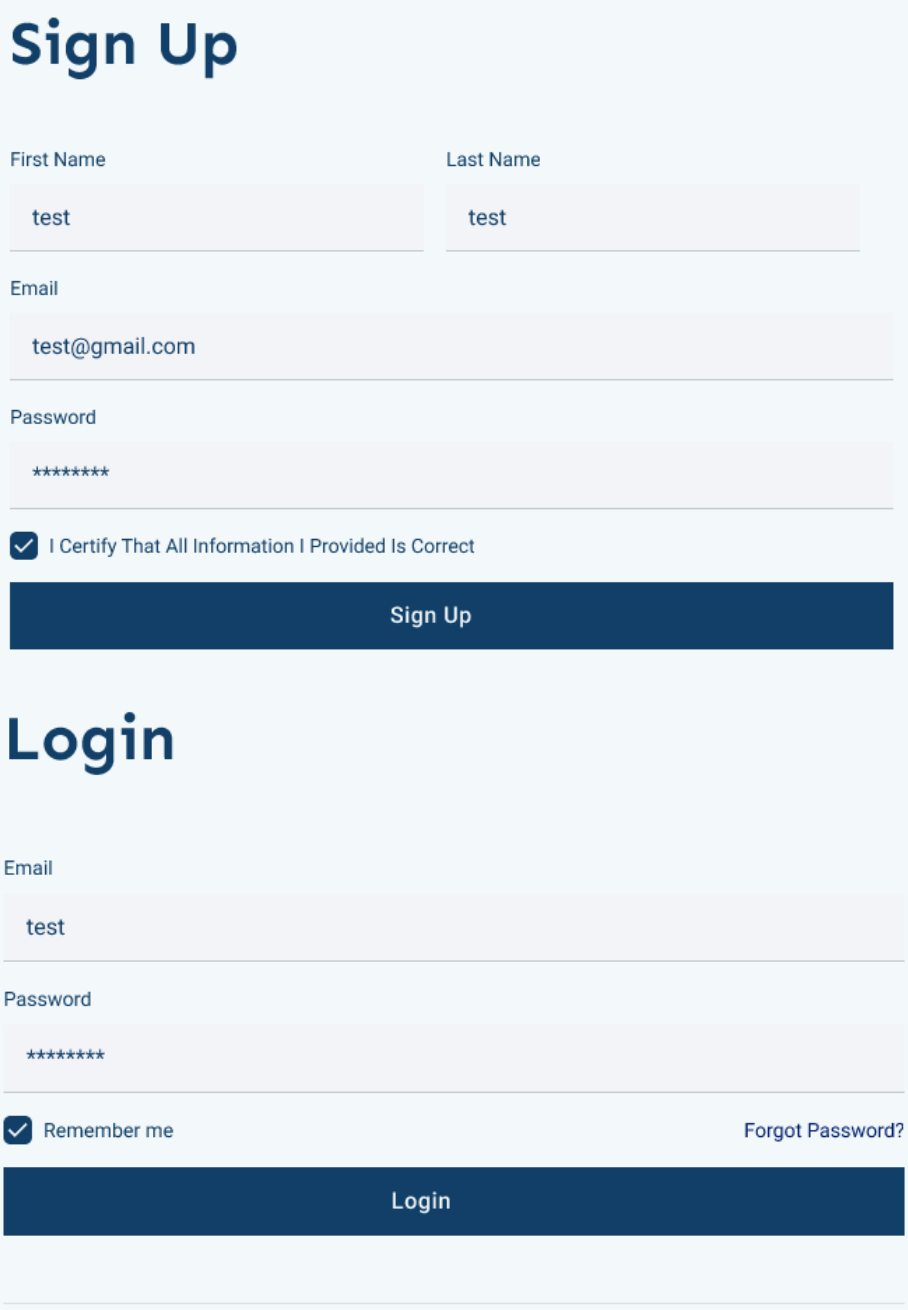

- Functional Input fields: I used variants to make the input fields match the final product input fields process as shown in the pictures.

Reviewing end-user feedback from multiple iterations of your prototype and justifying the updates to the final prototype based on end user feedback and testing.

In my project, I collected valuable feedback information from users as the evaluation methods I use Ire surveys for low-fidelity, A/B testing, and unmoderated usability testing for mid-fidelity.

	Low fidelity	**Mid fidelity**
Iteration 1	I used survey to validate the layout, the element positions, number of pages, and cover all ideas.	I used A/B testing to find out whether another design is better.
Iteration 1 result	I found out that the “cart” in the navbar is not clear, so I change its position, and I change its layout.	I found out that the original design is better (the control)
Iteration 2	I used survey to validate the findings from iteration 1 and what else I should change.	I used unmoderated usability testing as I sent the link to users with instructions to find out if I can go on and create high fidelity prototype or change anything before creating the high fidelity.
Iteration 2 result	I found out that material page is unclear, footer size is big, and “enroll now” button is not good	The result was very good everyone was satisfied with the mid fidelity result and I made sure that there are not any issues after applying feedback from the previous iterations so it was like an approval as I can go on and create the high fidelity prototype without any change.

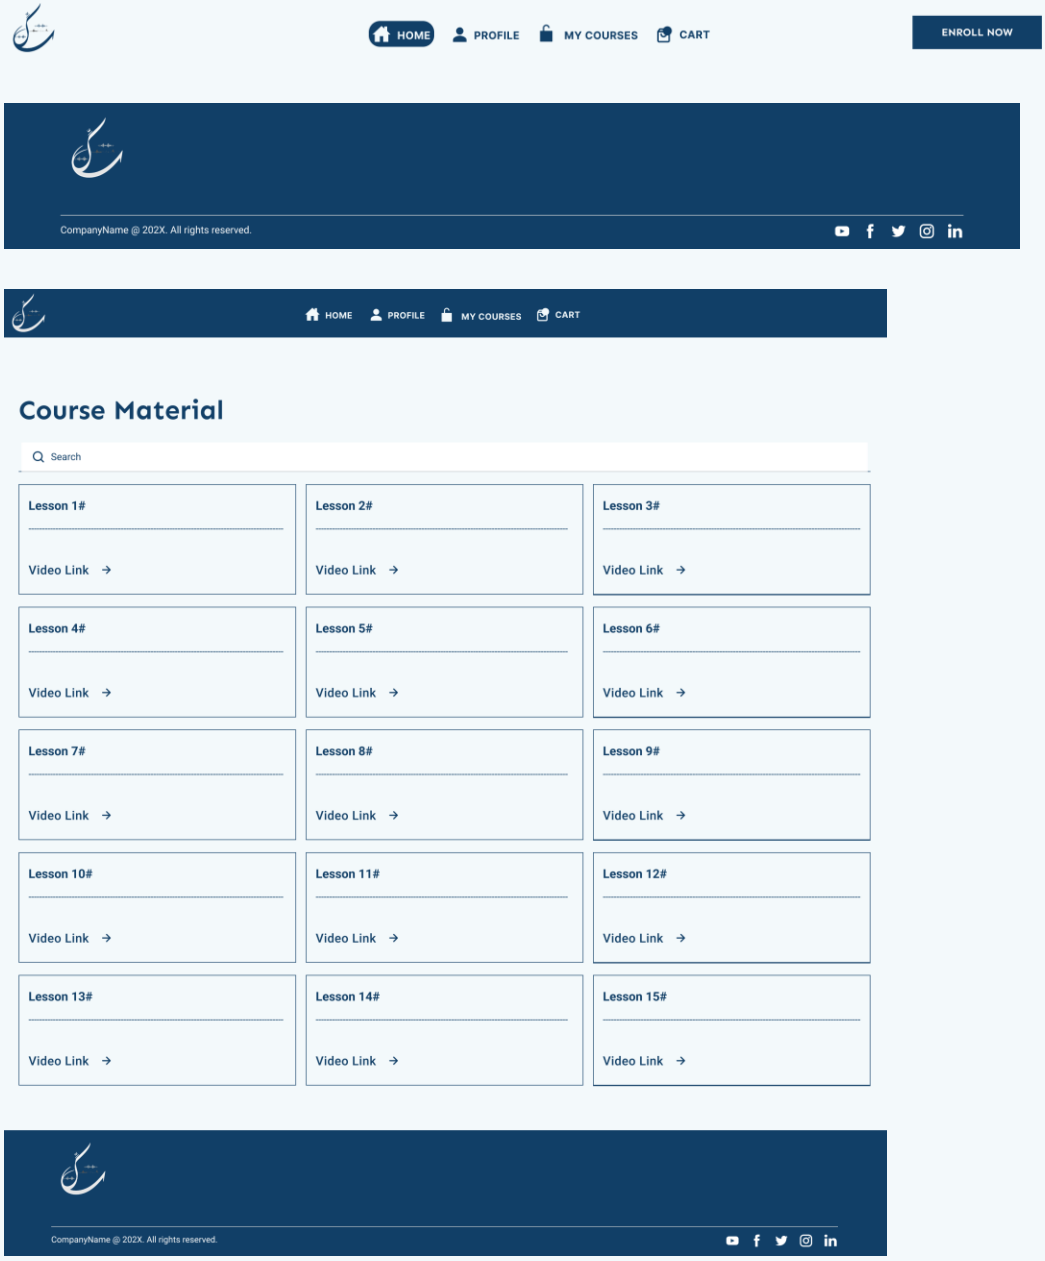

In the high-fidelity I applied all the feedback I collected to make sure that there is not any issue and I added page flow or navigation, transitions, smart smooth scroll for the CTA button along with the hover, interactive checkboxes, interactive buttons as I added hover to these buttons, realistic cart and add to cart process, and functional input fields which makes the high-fidelity prototype very similar to the final product as I showed in the previous question 8.1.

Pictures from the high-fidelity after applying all the feedback to the low-fidelity, and mid-fidelity:

- iteration 1 result from the low fidelity (“cart” in the navbar):

- iteration 2 result from the low fidelity (material page, big footer, CTA button):

- iteration 1 result from the mid fidelity: Here we found out that design A is better which will be shown in the video.
- iteration 2 result from the mid fidelity (Very good response from the users): here their responses were very good, and I made sure that there were not any issues after applying feedback from the previous iterations, so it was like an approval to go on and create the high-fidelity prototype.

Critically evaluating the prototype against the original plan and how user feedback and testing was implemented.

Let's start from the beginning of working on the project, I started the project by exploring the idea, making research and analysis. Then after choosing the right idea which is "Takke", I started making my plan which was that identify the target audience, and I will make user categorization, personas, value proposition canvas, segmentation, and behavior modelling technique. After that I choose the suitable methodology for my project, and I choose rapid throwaway because I understand that not all the requirements are clear. After that I planned for the tools, I will use such as Figma, ready to use templates, and google forms. I also planned for the evaluation methods that I will use which are surveys for low-fidelity for iteration one and two, A/B testing in iteration one of the mid-fidelity, and unmoderated usability testing for iteration two in the mid-fidelity.

After I summarized the original plan, we will now evaluate the prototype against that original plan and how user feedback and testing was implemented.

The plan was very good from all perspectives especially from the start of the project to choosing the evaluation methods, and I can create everything based on the plan without the need of the users, but user feedback was very important because who will use the platform me or the users? Also, the requirements were not fully clear so user feedback helped me to shape the project, understand and have clear idea on some requirements, and they made me realize things that I did not think about it as the original plan did not have any issues, but users had another view, so they countered some issues during the iterations.

In iteration one of the low-fidelity prototype, I used survey to validate the layout, the element positions, number of pages, and cover all ideas and I found out that the "cart" in the navbar is not clear, so I change its position, and I change its layout. In iteration two of the low-fidelity prototype, I also used survey to validate the findings from iteration 1 and what else I should change, and I found out that material page is unclear, footer size is big, and "enroll now" button is not good. These findings were very good as they were not implemented in the original plan, but the users have another view and found out which is not good about the application.

In iteration two of the mid-fidelity prototype, I used A/B testing to find out whether another design is better I found out that the original design is better (the control) so I did not choose the other new design. In iteration two of the mid-fidelity prototype I used unmoderated usability testing as I sent the link to users with instructions to find out if I can go on and create high fidelity prototype or change anything before creating the high fidelity and The result was very good everyone was satisfied with the mid fidelity result and I made sure that there are not any issues after applying feedback from the previous iterations so it was like an approval as I can go on and create the high fidelity prototype without any change.

The methodology used was implemented carefully as it helped me to make fast iterations, fast edits to the website, and reduced the risk of misunderstanding. The tools used such as Figma, ready-to-use templates, and google forms were effectively used, as I used Figma to create the

low, mid, and high-fidelity prototypes, templates helped me to create user classification and apply behavior modelling techniques like BJ FOGG's, and google forms helped me to make surveys and comparison in the iterations. Also, evaluation method were fully implemented but the only thing changed is the feedback edits as at the start I didn't think that users will counter any issues and I will not edit anything but users countered issues and I edited these issues which made the platform better and made me produce a high-quality high-fidelity prototype that is similar to the final product.
